A suite of professional editing tools is available in Photoshop, but you can also perform

all the editing that you could do in Photoshop (and much more) in a suite of related software programs, starting with Adobe Elements. You can find more information on Elements at [`www.adobe.com/elements`](http://www.adobe.com/elements).

## Photoshop Elements user interface

When you open Photoshop Elements, it will automatically open your last image. This process is repeated every time you open the app and you can close it when you're done with your editing. The app has two panels and looks like this: The Library panel is on the left, it contains all the images you previously opened and the folders that contain them. You can then move images into folders and load them all at once. The Toolbox panel is on the right, it contains all the tools you can use to edit your images. The tool options are displayed in a menu and

In terms of code structure (not a design issue), which snippet would you go for? Is it better to have a function that

---

reads data out of a file into a buffer (stored in the class) or a method that returns the data directly? The only reason I am asking this is because some of my C++ friends may be working on something like this and I want to make sure I get it right. So far all the resources I have found argue both sides, with no single good answer. In terms of code structure (not a design issue), which snippet would you go for? I am the world's most boring C++ programmer, but I still write some things like that. The only reason I am asking this is because some of my C++

In this day and age, with C++11, providing your C++11 compiler is up-to-date, I would recommend using a lambda with a `std::stringstream` for an output stream. I suggest avoiding writing a C++ class if you can use a `std::vector`. It makes your memory management less complicated. It seems that this is the "average" approach for reading data into a struct, and I understand why, but what I'm mostly interested in, is whether one is better, or "safer" and

can be considered "good practice". I currently use a
