The Adobe Muse Platform Adobe created the Adobe Muse platform with the goal of creating a fast, simple, and affordable website design tool. Adobe Muse is a browser plug-in or piece of software designed to make it easier to create websites. Once you create the site using Adobe Muse, you download the site to a web server where it can be viewed in a web browser. Adobe Muse

is also a powerful Flash animation tool. You can create and add interactive elements to your website to engage your visitors and increase your online presence. Like many Adobe software products, Muse is a cross between a word processor, an image editor, and an application-design tool. But it gives you the flexibility to create web pages with a design, layout, and interactivity similar to desktop publishing programs. Adobe calls Muse "a digital publishing platform

for building websites and creating interactive content that makes you look and feel like a pro." Part V # The Part of Tens In this part... The United Kingdom's drug control agency has published new guidance on the use of vaping products that seek to differentiate between the use of electronic cigarettes and traditional cigarettes. The guidance is for healthcare professionals in the UK, and as such, those outside the UK will not be able to take it into account. It says the guidance is needed as researchers and

public health professionals are looking into the potential benefits of using e-cigarettes. As an example, the document cites evidence in which e-cigarettes might reduce nicotine cravings or promote smoking cessation. The guidance also says that vaping devices may also be used to administer medical therapies to users of other products. The guidance defines vaping as the use of electronic cigarettes or other products that heat a liquid solution and produce a

vapour. It says that vaping products are distinct from smokeless tobacco in that they vaporise solutions other than tobacco, they are delivered through a vapour rather than smoke, and that they can be used without the use of combustible tobacco. It also defines the term "e-liquid" as "a mixture of propylene glycol, glycerin and nicotine for inhalation as a vapour through an electronic cigarette." The document notes that nicotine is the primary

component of tobacco, but that it is also the primary component of e-cigarette liquid. It also cites evidence showing that the levels of nicotine in the bloodstream of e-cigarette users are lower than in smokers of traditional cigarettes. To help clinicians differentiate e-cigarettes from traditional cigarettes, the guidance recommends that healthcare professionals should focus on symptoms, adverse effects, and addiction potential.

It also notes that the potential for e-cigarette liquids to contain contaminants can be a concern, and that research needs to be done on the long-term effects of their use. According to the guidance, a smoker of a conventional cigarette typically smokes an average of nine cigarettes a day, which equates to about 3.6g of nicotine. The same smoker would typically inhale about 4.5g of smoke per cigarette, containing about 0.5g of nicotine. Inhalation of a 6g "high-

strength" nicotine liquid in a e-cigarette would result in about the same amount of nicotine being inhaled, with the liquid delivering about 1.8g of nicotine. The guidance does not define the term "high strength." E-cigarettes were originally designed to help smokers quit by providing a way of delivering nicotine without the burning of tobacco. The devices vaporise a liquid solution to produce a
